entire cargo, but only of that part accessible and sampled at the date, time, and place of inspection. Sampling from any stationary stockpile is considered to be non-truly representative for the obvious reasons: the material is in static condition, not in movement and all the inner layers of material inside the pile are not accessible during sampling from the stockpile. Sampling will be carried out manually at depth 40cm from the pile's surface. Samplings from stockpiles are always limited. As a stationary stockpile limited sampling may not be truly representative of the entire cargo lot, the results of analysis may reflect the quality of the collected samples only. Therefore, the stockpile pre-loading inspection findings may be used for the indicative / informative or estimation Purposes only prior to loading and none can be used for any kind of commercial final purposes or transactions.
